Abstract not available for JP2005521148T

Abstract of corresponding document: **WO03081365**

In a method of entering text into an electronic communications device by means of a keypad having a number of keys, each key representing a plurality of letters and/or phonetic symbols, entered text is displayed on a display on the device. Possible phonetic syllables corresponding to an activated key sequence are generated. These are compared with a stored vocabulary comprising syllables and corresponding characters occurring in a given language. Those stored syllables and corresponding characters that match the possible syllables are pre-selected; and a number of these are presented in a separate first graphical object (11) arranged predominantly on the display. Characters corresponding to one of the syllables in the first object are simultaneously presented in a second graphical object (21). Thus there is provided a way of entering text with characters having a phonetic representation by means of keys representing a plurality of letters or phonetic symbols, which is easier to use even in the case where a phonetic syllable corresponds to several characters.
